

FENRIS

8 - 64 Port PCI Serial Card for Macintosh

Fenris adds 8 to 64 "smart" RS-232 serial ports to your PCI Power PC Macintosh. An on-board RISC processor and half a megabyte of on-board buffering ensures minimal loading of your Macintosh while supporting serial data rates up to 115,200 baud per port. Fenris is a perfect way to support any medium to large Mac BBS, multi-line fax or mail server, or to control multiple serial hardware devices. Multiple Fenris cards may be used in a single Macintosh to provide additional ports.

MegaWolf is a leader in Macintosh PCI serial expansion products, having released its "Fenris" line of expandable multiport PCI serial cards in the first quarter of 1996 and its inexpensive 8 port "Rufus" card in October 1996. Products planned for the near future include reasonably priced 2 and 4 port RS-422 Macintosh PCI Serial Expansion cards.

Fenris Specifications:

- 8 - 64 serial ports per PCI card.
- Modular design - expandable as needed.
- On-board processor & 512K RAM.
- Up to 115,200 baud per port.
- Supports RTS, CTS, DTR, DSR, CD, RI.
- PC-standard RS-232 ports.
